In this report, the authors review the current literature on data quality, develop a three-way scheme for classifying data quality problems, and apply the classification to the analysis of an important logistics data element, the End Item Code EIC. This study develops an analysis framework--footprint configuration--to assist in devising and evaluating such comprehensive strategies. Finally, the long-term benefits of modern, common testing equipment make a strong case for making common families be the foundation of automatic test system acquisition for future platforms.

Thus, resources should be prepositioned, either at the base or at a regional level.
