In many decision processes and routines the value over time of benefits will be discounted through a subjective discount rate to keep into account time distance and uncertainty. The total quantity of real GDP demanded increases at each price level. Investment is a component of Aggregate Demand AD and also influences the capital stock and productive capacity of the economy long-run aggregate supply Summary Increase and Decrease in Investment Investment levels are influenced by: Needless to say, business cycles have many sources and paths, thus wide differences. Countries differ a lot in respect to investment levels and dynamics. There is strong empirical evidence that investment is cyclical.

The extent to which investment responds to a change in interest rates is crucial. If interest rates rise, firms may anticipate that consumers will reduce their spending, and the benefit of investing will be lost. Therefore, it is incorrect to say that a fall in planned saving will increase national income in the long term.
